

A handoff is not complete because a card says Done.

Client onboarding fails quietly when ownership, dependencies, blockers, or completion evidence disappear between teams.

The Day 12 workflow makes each of those conditions visible.

Five visible states. No silent completion.

READY - prerequisites are satisfied and work may proceed.

WAITING - a required predecessor is not complete.

BLOCKED - an explicit blocker prevents progress.

REVIEW - evidence, ownership, or inputs are missing or contradictory.

COMPLETE - required dependencies and completion evidence are satisfied.

Dependencies are gates, not decoration.

A downstream step cannot become COMPLETE while a named predecessor remains incomplete.

An active blocker remains visible. Missing ownership and contradictory evidence route to REVIEW instead of being guessed.

The proof is the decision path.

Synthetic cases exercise completion evidence, dependency blocking, active blockers, missing owners, contradictory evidence, and export preservation.

The export keeps the visible status, reason, dependencies, blocker, and evidence references.

What this release does - and does not - claim.

It demonstrates deterministic onboarding handoff logic with synthetic records.

It does not claim faster onboarding, higher retention, revenue impact, CRM integration, regulated-data readiness, or replacement of human judgment.

Adapt the checklist. Challenge every handoff.

Can you see every required step? Is an owner explicit? Are blockers visible? Do dependencies actually gate completion? Is completion backed by evidence? Does export preserve the same state?
